1 Transitions

This theory contains more facts about closure, the definition of full transformations, and well-foundedness.

1.1 More theorems about Closures

This is the equivalent of $?r \le ?s \Longrightarrow ?r^{**} \le ?s^{**}$ for *tranclp*

lemma *tranclp-mono-explicit*:
$r^{++}\ a\ b \Longrightarrow r \le s \Longrightarrow s^{++}\ a\ b$
using *rtranclp-mono* **by** (*auto dest*!: *tranclpD intro*: *rtranclp-into-tranclp2*)

lemma *tranclp-mono*:
assumes *mono*: $r \le s$
shows $r^{++} \le s^{++}$
using *rtranclp-mono*[*OF mono*] *mono* **by** (*auto dest*!: *tranclpD intro*: *rtranclp-into-tranclp2*)

lemma *tranclp-idemp-rel*:
$R^{++++}\ a\ b \longleftrightarrow R^{++}\ a\ b$
apply (*rule iffI*)
prefer *2* **apply** *blast*
by (*induction rule*: *tranclp-induct*) *auto*

Equivalent of $?r^{****} = ?r^{**}$

lemma *trancl-idemp*: $(r^+)^+ = r^+$

by *simp*

lemmas *tranclp-idemp*[*simp*] = *trancl-idemp*[*to-pred*]

This theorem already exists as $?r^{**}\ ?a\ ?b \equiv\ ?a =\ ?b \lor\ ?r^{++}\ ?a\ ?b$ (and sledgehammer uses it), but it makes sense to duplicate it, because it is unclear how stable the lemmas in Nitpick are.

lemma *rtranclp-unfold*: $rtranclp\ r\ a\ b \longleftrightarrow (a = b \lor tranclp\ r\ a\ b)$
by (*meson rtranclp.simps rtranclpD tranclp-into-rtranclp*)

lemma *tranclp-unfold-end*: $tranclp\ r\ a\ b \longleftrightarrow (\exists\, a'.\ rtranclp\ r\ a\ a' \land r\ a'\ b)$
by (*metis rtranclp.rtrancl-refl rtranclp-into-tranclp1 tranclp.cases tranclp-into-rtranclp*)

lemma *tranclp-unfold-begin*: $tranclp\ r\ a\ b \longleftrightarrow (\exists\, a'.\ r\ a\ a' \land rtranclp\ r\ a'\ b)$
by (*meson rtranclp-into-tranclp2 tranclpD*)

lemma *trancl-set-tranclp*: $(a,\ b) \in \{(b,a).\ P\ a\ b\}^{+} \longleftrightarrow P^{++}\ b\ a$
apply (*rule iffI*)
apply (*induction rule*: *trancl-induct*; *simp*)
apply (*induction rule*: *tranclp-induct*; *auto simp*: *trancl-into-trancl2*)
done

lemma *tranclp-rtranclp-rtranclp-rel*: $R^{++**}\ a\ b \longleftrightarrow R^{**}\ a\ b$
by (*simp add*: *rtranclp-unfold*)

lemma *tranclp-rtranclp-rtranclp*[*simp*]: $R^{++**} = R^{**}$
by (*fastforce simp*: *rtranclp-unfold*)

lemma *rtranclp-exists-last-with-prop*:
assumes $R\ x\ z$
and $R^{**}\ z\ z'$ **and** $P\ x\ z$

Sledgehammer parameters

sledgehammer-params[*debug*]

2 Various Lemmas

Close to $(\bigwedge n.\ \forall m<n.\ ?P\ m \Longrightarrow ?P\ n) \Longrightarrow ?P\ ?n$, but with a separation between zero and non-zero, and case names.

thm *nat-less-induct*
lemma *nat-less-induct-case*[*case-names 0 Suc*]:
assumes
P 0 **and**
$\bigwedge n.\ (\forall m < Suc\ n.\ P\ m) \Longrightarrow P\ (Suc\ n)$
shows *P n*
apply (*induction rule*: *nat-less-induct*)
by (*rename-tac n*, *case-tac n*) (*auto intro*: *assms*)

This is only proved in simple cases by auto. In assumptions, nothing happens, and $?P\ (if\ ?Q\ then\ ?x\ else\ ?y) = (\neg\ (?Q \wedge \neg\ ?P\ ?x \vee \neg\ ?Q \wedge \neg\ ?P\ ?y))$ can blow up goals (because of other if expression).

lemma *if-0-1-ge-0*[*simp*]:
$0 < (if\ P\ then\ a\ else\ (0::nat)) \longleftrightarrow P \wedge 0 < a$
by *auto*

Bounded function have not been defined in Isabelle.

definition *bounded* **where**
$bounded\ f \longleftrightarrow (\exists b.\ \forall n.\ f\ n \leq b)$

abbreviation *unbounded* :: $('a \Rightarrow 'b::ord) \Rightarrow bool$ **where**
$unbounded\ f \equiv \neg\ bounded\ f$

lemma *not-bounded-nat-exists-larger*:
fixes f :: *nat* $\Rightarrow$ *nat*
assumes *unbound*: *unbounded f*
shows $\exists\, n.\ f\ n > m \wedge n > n_0$
proof (*rule ccontr*)
assume H: $\neg$ *?thesis*
have *finite* $\{f\ n|n.\ n \leq n_0\}$
by *auto*
have $\bigwedge n.\ f\ n \leq$ *Max* $(\{f\ n|n.\ n \leq n_0\} \cup \{m\})$
apply (*case-tac* $n \leq n_0$)
apply (*metis* (*mono-tags*, *lifting*) *Max-ge Un-insert-right* ‹*finite* $\{f\ n\ |n.\ n \leq n_0\}$›
finite-insert insertCI mem-Collect-eq sup-bot.right-neutral)
by (*metis* (*no-types*, *lifting*) *H Max-less-iff Un-insert-right* ‹*finite* $\{f\ n\ |n.\ n \leq n_0\}$›
finite-insert insertI1 insert-not-empty leI sup-bot.right-neutral)
then show *False*
using *unbound* **unfolding** *bounded-def* **by** *auto*
qed

lemma *bounded-const-product*:
fixes k :: *nat* **and** f :: *nat* $\Rightarrow$ *nat*
assumes $k > 0$
shows *bounded f* $\longleftrightarrow$ *bounded* $(\lambda i.\ k * f\ i)$
unfolding *bounded-def* **apply** (*rule iffI*)
using *mult-le-mono2* **apply** *blast*
by (*meson assms le-less-trans less-or-eq-imp-le nat-mult-less-cancel-disj split-div-lemma*)

This lemma is not used, but here to show that a property that can be expected from *bounded* holds.

lemma *bounded-finite-linorder*:
fixes f :: $'a \Rightarrow 'a$ ::{*finite*, *linorder*}
shows *bounded f*
proof −
have $\bigwedge x.\ f\ x \leq$ *Max* $\{f\ x|x.\ True\}$
by (*metis* (*mono-tags*) *Max-ge finite mem-Collect-eq*)
then show *?thesis*
unfolding *bounded-def* **by** *blast*
qed

3 More List

3.1 *upt*

The simplification rules are not very handy, because [*?i..<Suc ?j*] = (*if ?i* ≤ *?j then* [*?i..<?j*] @ [*?j*] *else* []) leads to a case distinction, that we do not want if the condition is not in the context.

lemma *upt-Suc-le-append*: $\neg i \leq j \Longrightarrow [i..<Suc\ j] = []$
by *auto*

lemmas *upt-simps*[*simp*] = *upt-Suc-append upt-Suc-le-append*

declare *upt.simps*(*2*)[*simp del*]

lemma
  assumes $i \leq n - m$
  shows *take* i $[m..<n] = [m..<m+i]$
  by (*metis Nat.le-diff-conv2 add.commute assms diff-is-0-eq′ linear take-upt upt-conv-Nil*)

The counterpart for this lemma when $n - m < i$ is *length* $?xs \leq ?n \Longrightarrow$ *take* $?n$ $?xs = ?xs$. It is close to $?i + ?m \leq ?n \Longrightarrow$ *take* $?m$ $[?i..<?n] = [?i..<?i + ?m]$, but seems more general.

lemma *take-upt-bound-minus*[*simp*]:
  assumes $i \leq n - m$
  shows *take* i $[m..<n] = [m ..<m+i]$
  using *assms* **by** (*induction* i) *auto*

lemma *append-cons-eq-upt*:
  assumes A @ $B = [m..<n]$
  shows $A = [m ..<m+$*length* $A]$ **and** $B = [m +$ *length* $A..<n]$
proof −
  have *take* (*length* A) (A @ B) $= A$ **by** *auto*
  moreover
    have *length* $A \leq n - m$ **using** *assms linear calculation* **by** *fastforce*
    then have *take* (*length* A) $[m..<n] = [m ..<m+$*length* $A]$ **by** *auto*
  ultimately show $A = [m ..<m+$*length* $A]$ **using** *assms* **by** *auto*
  show $B = [m +$ *length* $A..<n]$ **using** *assms* **by** (*metis append-eq-conv-conj drop-upt*)
qed

lemma *length-list-Suc-0*:
  length $W =$ *Suc* $0 \longleftrightarrow (\exists L.\ W = [L])$
  apply (*cases* W)
    apply *simp*
  apply (*rename-tac* a W', *case-tac* W')
  apply *auto*
  done

lemma *length-list-2*: *length* $S = 2 \longleftrightarrow (\exists a\ b.\ S = [a, b])$
  apply (*cases* S)
   apply *simp*
  apply (*rename-tac* a S')
  apply (*case-tac* S')
  by *simp-all*

The converse of $?A$ @ $?B = [?m..<?n] \Longrightarrow ?A = [?m..<?m +$ *length* $?A]$
$?A$ @ $?B = [?m..<?n] \Longrightarrow ?B = [?m +$ *length* $?A..<?n]$ does not hold, for example if B is empty and A is $[0::'a]$:

lemma A @ $B = [m..< n] \longleftrightarrow A = [m ..<m+$*length* $A] \wedge B = [m +$ *length* $A..<n]$

oops

A more restrictive version holds:

lemma $B \neq [] \Longrightarrow A$ @ $B = [m..< n] \longleftrightarrow A = [m ..<m+$*length* $A] \wedge B = [m +$ *length* $A..<n]$
  (**is** $?P \Longrightarrow ?A = ?B$)
proof
  assume $?A$ **then show** $?B$ **by** (*auto simp add*: *append-cons-eq-upt*)
next
  assume $?P$ **and** $?B$
  then show $?A$ **using** *append-eq-conv-conj* **by** *fastforce*

qed

lemma *append-cons-eq-upt-length-i*:
  assumes A @ i # B = $[m..<n]$
  shows $A = [m\ ..<i]$

qed

3.2 Lexicographic Ordering

lemma *lexn-Suc*:
  $(x \# xs, y \# ys) \in lexn\ r\ (Suc\ n) \longleftrightarrow$
  $(length\ xs = n \wedge length\ ys = n) \wedge ((x, y) \in r \vee (x = y \wedge (xs, ys) \in lexn\ r\ n))$
  by (*auto simp*: *map-prod-def image-iff lex-prod-def*)

lemma *lexn-n*:
  $n > 0 \Longrightarrow (x \# xs, y \# ys) \in lexn\ r\ n \longleftrightarrow$
  $(length\ xs = n-1 \wedge length\ ys = n-1) \wedge ((x, y) \in r \vee (x = y \wedge (xs, ys) \in lexn\ r\ (n - 1)))$
  apply (*cases n*)
   apply *simp*
  by (*auto simp*: *map-prod-def image-iff lex-prod-def*)

There is some subtle point in the proof here. *1* is converted to *Suc 0*, but *2* is not: meaning that *1* is automatically simplified by default using the default simplification rule $lexn\ ?r\ 0 = \{\}$
$lexn\ ?r\ (Suc\ ?n) = map\text{-}prod\ (\lambda(x, xs).\ x \# xs)\ (\lambda(x, xs).\ x \# xs)\ `\ (?r <*lex*> lexn\ ?r\ ?n) \cap \{(xs, ys).\ length\ xs = Suc\ ?n \wedge length\ ys = Suc\ ?n\}$. However, the latter needs additional simplification rule.

lemma *lexn2-conv*:
  $([a, b], [c, d]) \in lexn\ r\ 2 \longleftrightarrow (a, c) \in r \vee (a = c \wedge (b, d) \in r)$
  by (*auto simp*: *lexn-n simp del*: *lexn.simps*(*2*))

lemma *lexn3-conv*:
  $([a, b, c], [a', b', c']) \in lexn\ r\ 3 \longleftrightarrow$
    $(a, a') \in r \vee (a = a' \wedge (b, b') \in r) \vee (a = a' \wedge b = b' \wedge (c, c') \in r)$
  by (*auto simp*: *lexn-n simp del*: *lexn.simps*(*2*))

3.3 Remove and Multiset equality

lemma *remove1-mset-single-add*:
  $a \neq b \Longrightarrow remove1\text{-}mset\ a\ (\{\#b\#\} + C) = \{\#b\#\} + remove1\text{-}mset\ a\ C$
  $remove1\text{-}mset\ a\ (\{\#a\#\} + C) = C$
  by (*auto simp*: *multiset-eq-iff*)

This is the sams as *remove1* under the assumptions of non-duplication inside a clause.

fun *remove1-cond* **where**
$remove1\text{-}cond\ f\ [] = []\ |$
$remove1\text{-}cond\ f\ (C' \# L) = (if\ f\ \ C'\ then\ L\ else\ C' \# remove1\text{-}cond\ f\ L)$

lemma *mset-map-mset-remove1-cond*:
  $mset\ (map\ mset\ (remove1\text{-}cond\ (\lambda L.\ mset\ L = mset\ a)\ C)) =$
    $remove1\text{-}mset\ (mset\ a)\ (mset\ (map\ mset\ C))$
  by (*induction C*) (*auto simp*: *ac-simps remove1-mset-single-add*)

4 Logics

In this section we define the syntax of the formula and an abstraction over it to have simpler proofs. After that we define some properties like subformula and rewriting.

4.1 Definition and abstraction

The propositional logic is defined inductively. The type parameter is the type of the variables.

datatype *'v propo* =
FT | *FF* | *FVar 'v* | *FNot 'v propo* | *FAnd 'v propo 'v propo* | *FOr 'v propo 'v propo*
| *FImp 'v propo 'v propo* | *FEq 'v propo 'v propo*

We do not define any notation for the formula, to distinguish properly between the formulas and Isabelle's logic.

To ease the proofs, we will write the the formula on a homogeneous manner, namely a connecting argument and a list of arguments.

datatype *'v connective* = *CT* | *CF* | *CVar 'v* | *CNot* | *CAnd* | *COr* | *CImp* | *CEq*

abbreviation *nullary-connective* ≡ {*CF*} ∪ {*CT*} ∪ {*CVar x* | *x*. *True*}
definition *binary-connectives* ≡ {*CAnd*, *COr*, *CImp*, *CEq*}

We define our own induction principal: instead of distinguishing every constructor, we group them by arity.

lemma *propo-induct-arity*[*case-names nullary unary binary*]:
fixes $\varphi\ \psi$ :: $'v$ *propo*
assumes *nullary*: $(\bigwedge\varphi\ x.\ \varphi = FF \lor \varphi = FT \lor \varphi = FVar\ x \Longrightarrow P\ \varphi)$
and *unary*: $(\bigwedge\psi.\ P\ \psi \Longrightarrow P\ (FNot\ \psi))$
and *binary*: $(\bigwedge\varphi\ \psi 1\ \psi 2.\ P\ \psi 1 \Longrightarrow P\ \psi 2 \Longrightarrow \varphi = FAnd\ \psi 1\ \psi 2 \lor \varphi = FOr\ \psi 1\ \psi 2 \lor \varphi = FImp\ \psi 1\ \psi 2$
$\lor\ \varphi = FEq\ \psi 1\ \psi 2 \Longrightarrow P\ \varphi)$
shows $P\ \psi$
apply (*induct rule*: *propo.induct*)
using *assms* **by** *metis+*

The function *conn* is the interpretation of our representation (connective and list of arguments). We define any thing that has no sense to be false

fun *conn* :: $'v$ *connective* $\Rightarrow$ $'v$ *propo list* $\Rightarrow$ $'v$ *propo* **where**
conn CT [] = FT |
conn CF [] = FF |
conn ($CVar\ v$) [] = $FVar\ v$ |
conn $CNot$ [φ] = $FNot\ \varphi$ |
conn $CAnd$ (φ # [ψ]) = $FAnd\ \varphi\ \psi$ |
conn COr (φ # [ψ]) = $FOr\ \varphi\ \psi$ |
conn $CImp$ (φ # [ψ]) = $FImp\ \varphi\ \psi$ |
conn CEq (φ # [ψ]) = $FEq\ \varphi\ \psi$ |
conn - - = FF

We will often use case distinction, based on the arity of the $'v$ *connective*, thus we define our own splitting principle.

lemma *connective-cases-arity*[*case-names nullary binary unary*]:
assumes *nullary*: $\bigwedge x.\ c = CT \lor c = CF \lor c = CVar\ x \Longrightarrow P$
and *binary*: $c \in$ *binary-connectives* $\Longrightarrow P$
and *unary*: $c = CNot \Longrightarrow P$
shows P
using *assms* **by** (*cases c*) (*auto simp*: *binary-connectives-def*)

lemma *connective-cases-arity-2*[*case-names nullary unary binary*]:
assumes *nullary*: $c \in$ *nullary-connective* $\Longrightarrow P$
and *unary*: $c = CNot \Longrightarrow P$
and *binary*: $c \in$ *binary-connectives* $\Longrightarrow P$
shows P
using *assms* **by** (*cases c*, *auto simp add*: *binary-connectives-def*)

Our previous definition is not necessary correct (connective and list of arguments) , so we define an inductive predicate.

inductive *wf-conn* :: $'v$ *connective* $\Rightarrow$ $'v$ *propo list* $\Rightarrow$ *bool* **for** c :: $'v$ *connective* **where**
wf-conn-nullary[*simp*]: ($c = CT \lor c = CF \lor c = CVar\ v$) $\Longrightarrow$ *wf-conn* c [] |
wf-conn-unary[*simp*]: $c = CNot \Longrightarrow$ *wf-conn* c [ψ] |
wf-conn-binary[*simp*]: $c \in$ *binary-connectives* $\Longrightarrow$ *wf-conn* c (ψ # ψ' # [])
thm *wf-conn.induct*
lemma *wf-conn-induct*[*consumes 1*, *case-names CT CF CVar CNot COr CAnd CImp CEq*]:
assumes *wf-conn* $c\ x$ **and**
($\bigwedge v.\ c = CT \Longrightarrow P$ []) **and**
($\bigwedge v.\ c = CF \Longrightarrow P$ []) **and**
($\bigwedge v.\ c = CVar\ v \Longrightarrow P$ []) **and**
($\bigwedge \psi.\ c = CNot \Longrightarrow P$ [ψ]) **and**
($\bigwedge \psi\ \psi'.\ c = COr \Longrightarrow P$ [ψ, ψ']) **and**

$(\bigwedge\psi\ \psi'.\ c = CAnd \Longrightarrow P\ [\psi, \psi'])$ **and**
$(\bigwedge\psi\ \psi'.\ c = CImp \Longrightarrow P\ [\psi, \psi'])$ **and**
$(\bigwedge\psi\ \psi'.\ c = CEq \Longrightarrow P\ [\psi, \psi'])$
shows $P\ x$
using *assms* **by** *induction* (*auto simp*: *binary-connectives-def*)

4.2 properties of the abstraction

First we can define simplification rules.

lemma *wf-conn-conn*[*simp*]:
wf-conn $CT\ l \Longrightarrow$ *conn* $CT\ l = FT$
wf-conn $CF\ l \Longrightarrow$ *conn* $CF\ l = FF$
wf-conn $(CVar\ x)\ l \Longrightarrow$ *conn* $(CVar\ x)\ l = FVar\ x$
apply (*simp-all add*: *wf-conn.simps*)
unfolding *binary-connectives-def* **by** *simp-all*

lemma *wf-conn-list-decomp*[*simp*]:
wf-conn $CT\ l \longleftrightarrow l = []$
wf-conn $CF\ l \longleftrightarrow l = []$
wf-conn $(CVar\ x)\ l \longleftrightarrow l = []$
wf-conn $CNot\ (\xi\ @\ \varphi\ \#\ \xi') \longleftrightarrow \xi = [] \land \xi' = []$
apply (*simp-all add*: *wf-conn.simps*)
unfolding *binary-connectives-def* **apply** *simp-all*
by (*metis append-Nil append-is-Nil-conv list.distinct*(*1*) *list.sel*(*3*) *tl-append2*)

lemma *wf-conn-list*:
wf-conn $c\ l \Longrightarrow$ *conn* $c\ l = FT \longleftrightarrow (c = CT \land l = [])$
wf-conn $c\ l \Longrightarrow$ *conn* $c\ l = FF \longleftrightarrow (c = CF \land l = [])$
wf-conn $c\ l \Longrightarrow$ *conn* $c\ l = FVar\ x \longleftrightarrow (c = CVar\ x \land l = [])$
wf-conn $c\ l \Longrightarrow$ *conn* $c\ l = FAnd\ a\ b \longleftrightarrow (c = CAnd \land l = a\ \#\ b\ \#\ [])$
wf-conn $c\ l \Longrightarrow$ *conn* $c\ l = FOr\ a\ b \longleftrightarrow (c = COr \land l = a\ \#\ b\ \#\ [])$
wf-conn $c\ l \Longrightarrow$ *conn* $c\ l = FEq\ a\ b \longleftrightarrow (c = CEq \land l = a\ \#\ b\ \#\ [])$
wf-conn $c\ l \Longrightarrow$ *conn* $c\ l = FImp\ a\ b \longleftrightarrow (c = CImp \land l = a\ \#\ b\ \#\ [])$
wf-conn $c\ l \Longrightarrow$ *conn* $c\ l = FNot\ a \longleftrightarrow (c = CNot \land l = a\ \#\ [])$
apply (*induct l rule*: *wf-conn.induct*)
unfolding *binary-connectives-def* **by** *auto*

In the binary connective cases, we will often decompose the list of arguments (of length 2) into two elements.

lemma *list-length2-decomp*: *length* $l = 2 \Longrightarrow (\exists\ a\ b.\ l = a\ \#\ b\ \#\ [])$
apply (*induct l*, *auto*)
by (*rename-tac l*, *case-tac l*, *auto*)

wf-conn for binary operators means that there are two arguments.

lemma *wf-conn-bin-list-length*:
fixes l :: *'v propo list*
assumes *conn*: $c \in$ *binary-connectives*
shows *length* $l = 2 \longleftrightarrow$ *wf-conn* $c\ l$
proof
assume *length* $l = 2$
then show *wf-conn* $c\ l$ **using** *wf-conn-binary list-length2-decomp* **using** *conn* **by** *metis*
next

assume *wf-conn c l*
then show *length l = 2* (**is** *?P l*)
proof (*cases rule*: *wf-conn.induct*)
case *wf-conn-nullary*
then show *?P* [] **using** *conn binary-connectives-def*
using *connective.distinct*(*11*) *connective.distinct*(*13*) *connective.distinct*(*9*) **by** *blast*
next
fix ψ :: *'v propo*
case *wf-conn-unary*
then show *?P* [ψ] **using** *conn binary-connectives-def*
using *connective.distinct* **by** *blast*
next
fix ψ ψ':: *'v propo*
show *?P* [ψ, ψ'] **by** *auto*
qed
qed

lemma *wf-conn-not-list-length*[*iff*]:
fixes *l* :: *'v propo list*
shows *wf-conn CNot l* $\longleftrightarrow$ *length l = 1*
apply *auto*
apply (*metis append-Nil connective.distinct*(*5*,*17*,*27*) *length-Cons list.size*(*3*) *wf-conn.simps wf-conn-list-decomp*(*4*))
by (*simp add*: *length-Suc-conv wf-conn.simps*)

Decomposing the Not into an element is moreover very useful.

lemma *wf-conn-Not-decomp*:
fixes *l* :: *'v propo list* **and** *a* :: *'v*
assumes *corr*: *wf-conn CNot l*
shows $\exists$ *a*. *l* = [*a*]
by (*metis* (*no-types*, *lifting*) *One-nat-def Suc-length-conv corr length-0-conv wf-conn-not-list-length*)

The *wf-conn* remains correct if the length of list does not change. This lemma is very useful when we do one rewriting step

lemma *wf-conn-no-arity-change*:
length l = length l' $\Longrightarrow$ *wf-conn c l* $\longleftrightarrow$ *wf-conn c l'*
proof −
{
fix *l l'*
have *length l = length l'* $\Longrightarrow$ *wf-conn c l* $\Longrightarrow$ *wf-conn c l'*
apply (*cases c l rule*: *wf-conn.induct*, *auto*)
by (*metis wf-conn-bin-list-length*)
}
then show *length l = length l'* $\Longrightarrow$ *wf-conn c l = wf-conn c l'* **by** *metis*
qed

lemma *wf-conn-no-arity-change-helper*:
length (ξ @ φ # ξ') = *length* (ξ @ φ' # ξ')
by *auto*

The injectivity of *conn* is useful to prove equality of the connectives and the lists.

lemma *conn-inj-not*:
assumes *correct*: *wf-conn c l*
and *conn*: *conn c l = FNot* ψ

```
  shows c = CNot and l = [ψ]
  apply (cases c l rule: wf-conn.cases)
  using correct conn unfolding binary-connectives-def apply auto
  apply (cases c l rule: wf-conn.cases)
  using correct conn unfolding binary-connectives-def by auto
```

```
lemma conn-inj:
  fixes c ca :: 'v connective and l ψs :: 'v propo list
  assumes corr: wf-conn ca l
  and corr': wf-conn c ψs
  and eq: conn ca l = conn c ψs
  shows ca = c ∧ ψs = l
  using corr
proof (cases ca l rule: wf-conn.cases)
  case (wf-conn-nullary v)
  then show ca = c ∧ ψs = l using assms
      by (metis conn.simps(1) conn.simps(2) conn.simps(3) wf-conn-list(1−3))
next
  case (wf-conn-unary ψ')
  then have ∗: FNot ψ' = conn c ψs using conn-inj-not eq assms by auto
  then have c = ca by (metis conn-inj-not(1) corr' wf-conn-unary(2))
  moreover have ψs = l using ∗ conn-inj-not(2) corr' wf-conn-unary(1) by force
  ultimately show ca = c ∧ ψs = l by auto
next
  case (wf-conn-binary ψ' ψ'')
  then show ca = c ∧ ψs = l
    using eq corr' unfolding binary-connectives-def apply (cases ca, auto simp add: wf-conn-list)
    using wf-conn-list(4−7) corr' by metis+
qed
```

4.3 Subformulas and properties

A characterization using sub-formulas is interesting for rewriting: we will define our relation on the sub-term level, and then lift the rewriting on the term-level. So the rewriting takes place on a subformula.

```
inductive subformula :: 'v propo ⇒ 'v propo ⇒ bool  (infix ⪯ 45) for φ where
subformula-refl[simp]: φ ⪯ φ |
subformula-into-subformula: ψ ∈ set l ⟹ wf-conn c l ⟹ φ ⪯ ψ ⟹ φ ⪯ conn c l
```

On the *subformula-into-subformula*, we can see why we use our *conn* representation: one case is enough to express the subformulas property instead of listing all the cases.

This is an example of a property related to subformulas.

```
lemma subformula-in-subformula-not:
shows b: FNot φ ⪯ ψ ⟹ φ ⪯ ψ
  apply (induct rule: subformula.induct)
  using subformula-into-subformula wf-conn-unary subformula-refl  list.set-intros(1) subformula-refl
    by (fastforce intro: subformula-into-subformula)+
```

```
lemma subformula-in-binary-conn:
  assumes conn: c ∈ binary-connectives
  shows f ⪯ conn c [f, g]
  and g ⪯ conn c [f, g]
proof −
```

5 Semantics over the syntax

Given the syntax defined above, we define a semantics, by defining an evaluation function *eval*. This function is the bridge between the logic as we define it here and the built-in logic of Isabelle.

fun *eval* :: $('v \Rightarrow bool) \Rightarrow$ *'v propo* $\Rightarrow$ *bool* $($**infix** $\models$ *50*$)$ **where**
$\mathcal{A} \models FT = True$ |
$\mathcal{A} \models FF = False$ |
$\mathcal{A} \models FVar\ v = (\mathcal{A}\ v)$ |
$\mathcal{A} \models FNot\ \varphi = (\neg(\mathcal{A} \models \varphi))$ |
$\mathcal{A} \models FAnd\ \varphi_1\ \varphi_2 = (\mathcal{A} \models \varphi_1 \wedge \mathcal{A} \models \varphi_2)$ |
$\mathcal{A} \models FOr\ \varphi_1\ \varphi_2 = (\mathcal{A} \models \varphi_1 \vee \mathcal{A} \models \varphi_2)$ |
$\mathcal{A} \models FImp\ \varphi_1\ \varphi_2 = (\mathcal{A} \models \varphi_1 \longrightarrow \mathcal{A} \models \varphi_2)$ |
$\mathcal{A} \models FEq\ \varphi_1\ \varphi_2 = (\mathcal{A} \models \varphi_1 \longleftrightarrow \mathcal{A} \models \varphi_2)$

definition *evalf* $($**infix** $\models f$ *50*$)$ **where**
evalf $\varphi\ \psi = (\forall A.\ A \models \varphi \longrightarrow A \models \psi)$

The deduction rule is in the book. And the proof looks like to the one of the book.

theorem *deduction-theorem*:
$(\varphi \models f\ \psi) \longleftrightarrow (\forall A.\ (A \models FImp\ \varphi\ \psi))$
proof
assume H: $\varphi \models f\ \psi$
{
fix A
have $A \models FImp\ \varphi\ \psi$
proof $($*cases* $A \models \varphi)$

case *True*
then have $A \models \psi$ **using** *H* **unfolding** *evalf-def* **by** *metis*
then show $A \models$ *FImp* φ ψ **by** *auto*
next
case *False*
then show $A \models$ *FImp* φ ψ **by** *auto*
qed
}
then show $\forall A.\ A \models$ *FImp* φ ψ **by** *blast*
next
assume A: $\forall A.\ A \models$ *FImp* φ ψ
show $\varphi \models f\ \psi$
proof (*rule ccontr*)
assume $\neg\ \varphi \models f\ \psi$
then obtain A **where** $A \models \varphi$ **and** $\neg\ A \models \psi$ **using** *evalf-def* **by** *metis*
then have $\neg\ A \models$ *FImp* φ ψ **by** *auto*
then show *False* **using** A **by** *blast*
qed
qed

A shorter proof:

lemma $\varphi \models f\ \psi \longleftrightarrow (\forall A.\ A \models$ *FImp* $\varphi\ \psi)$
by (*simp add*: *evalf-def*)

definition *same-over-set*:: $('v \Rightarrow bool) \Rightarrow ('v \Rightarrow bool) \Rightarrow 'v\ set \Rightarrow bool$ **where**
same-over-set $A\ B\ S = (\forall c \in S.\ A\ c = B\ c)$

If two mapping A and B have the same value over the variables, then the same formula are satisfiable.

lemma *same-over-set-eval*:
assumes *same-over-set* $A\ B$ (*vars-of-prop* φ)
shows $A \models \varphi \longleftrightarrow B \models \varphi$
using *assms* **unfolding** *same-over-set-def* **by** (*induct* φ, *auto*)

imports *Main Prop-Logic Wellfounded-More*

begin

This file is devoted to abstract properties of the transformations, like consistency preservation and lifting from terms to proposition.

6 Rewrite systems and properties

6.1 Lifting of rewrite rules

We can lift a rewrite relation r over a full1 formula: the relation r works on terms, while *propo-rew-step* works on formulas.

inductive *propo-rew-step* :: $('v\ propo \Rightarrow 'v\ propo \Rightarrow bool) \Rightarrow 'v\ propo \Rightarrow 'v\ propo \Rightarrow bool$
for r :: $'v\ propo \Rightarrow 'v\ propo \Rightarrow bool$ **where**
global-rel: $r\ \varphi\ \psi \Longrightarrow$ *propo-rew-step* $r\ \varphi\ \psi$ |
propo-rew-one-step-lift: *propo-rew-step* $r\ \varphi\ \varphi' \Longrightarrow$ *wf-conn* $c\ (\psi s\ @\ \varphi\ \#\ \psi s')$

$\Longrightarrow$ *propo-rew-step r* (*conn c* (ψs @ φ # $\psi s'$)) (*conn c* (ψs @ φ'# $\psi s'$))

Here is a more precise link between the lifting and the subformulas: if a rewriting takes place between φ and φ', then there are two subformulas ψ in φ and ψ' in φ', ψ' is the result of the rewriting of r on ψ.

This lemma is only a health condition:

lemma *propo-rew-step-subformula-imp*:
shows *propo-rew-step r* φ φ' $\Longrightarrow \exists\ \psi\ \psi'.\ \psi \preceq \varphi \wedge \psi' \preceq \varphi' \wedge r\ \psi\ \psi'$
 apply (*induct rule*: *propo-rew-step.induct*)
  using *subformula.simps subformula-into-subformula* **apply** *blast*
 using *wf-conn-no-arity-change subformula-into-subformula wf-conn-no-arity-change-helper in-set-conv-decomp* **by** *metis*

The converse is moreover true: if there is a ψ and ψ', then every formula φ containing ψ, can be rewritten into a formula φ', such that it contains φ'.

lemma *propo-rew-step-subformula-rec*:
 fixes $\psi\ \psi'\ \varphi$ :: *'v propo*
 shows $\psi \preceq \varphi \Longrightarrow r\ \psi\ \psi' \Longrightarrow (\exists\varphi'.\ \psi' \preceq \varphi' \wedge$ *propo-rew-step r* $\varphi\ \varphi')$
proof (*induct* φ *rule*: *subformula.induct*)

7 Transformation testing

7.1 Definition and first properties

To prove correctness of our transformation, we create a *all-subformula-st* predicate. It tests recursively all subformulas. At each step, the actual formula is tested. The aim of this *test-symb* function is to test locally some properties of the formulas (i.e. at the level of the connective or at first level). This allows a clause description between the rewrite relation and the *test-symb*

definition *all-subformula-st* :: ($'a$ *propo* $\Rightarrow$ *bool*) $\Rightarrow$ $'a$ *propo* $\Rightarrow$ *bool* **where**
all-subformula-st test-symb $\varphi \equiv \forall \psi.\ \psi \preceq \varphi \longrightarrow$ *test-symb* ψ

lemma *test-symb-imp-all-subformula-st*[*simp*]:
test-symb FT $\Longrightarrow$ *all-subformula-st test-symb FT*
test-symb FF $\Longrightarrow$ *all-subformula-st test-symb FF*
test-symb (*FVar x*) $\Longrightarrow$ *all-subformula-st test-symb* (*FVar x*)

7.2 Invariant conservation

If two rewrite relation are independant (or at least independant enough), then the property characterizing the first relation *all-subformula-st test-symb* remains true. The next show the same property, with changes in the assumptions.

The assumption $\forall\varphi'\ \psi.\ \varphi' \preceq \Phi \longrightarrow r\ \varphi'\ \psi \longrightarrow$ *all-subformula-st test-symb* $\varphi' \longrightarrow$ *all-subformula-st test-symb* ψ means that rewriting with r does not mess up the property we want to preserve locally.

The previous assumption is not enough to go from r to *propo-rew-step* r: we have to add the assumption that rewriting inside does not mess up the term: $\forall c\ \xi\ \varphi\ \xi'\ \varphi'.\ \varphi \preceq \Phi \longrightarrow$ *propo-rew-step* $r\ \varphi\ \varphi' \longrightarrow$ *wf-conn* $c\ (\xi\ @\ \varphi\ \#\ \xi') \longrightarrow$ *test-symb* (*conn* $c\ (\xi\ @\ \varphi\ \#\ \xi')) \longrightarrow$ *test-symb* $\varphi' \longrightarrow$ *test-symb* (*conn* $c\ (\xi\ @\ \varphi'\ \#\ \xi')$)

7.2.1 Invariant while lifting of the rewriting relation

The condition $\varphi \preceq \Phi$ (that will by used with $\Phi = \varphi$ most of the time) is here to ensure that the recursive conditions on Φ will moreover hold for the subterm we are rewriting. For example if there is no equivalence symbol in Φ, we do not have to care about equivalence symbols in the two previous assumptions.

begin

Given the previous definition about abstract rewriting and theorem about them, we now have the detailed rule making the transformation into CNF/DNF.

8 Rewrite Rules

The idea of Christoph Weidenbach's book is to remove gradually the operators: first equivalencies, then implication, after that the unused true/false and finally the reorganizing the or/and. We will prove each transformation seperately.

8.1 Elimination of the equivalences

The first transformation consists in removing every equivalence symbol.

inductive *elim-equiv* :: $'v$ *propo* $\Rightarrow$ $'v$ *propo* $\Rightarrow$ *bool* **where**
elim-equiv[*simp*]: *elim-equiv* (*FEq* φ ψ) (*FAnd* (*FImp* φ ψ) (*FImp* ψ φ))

lemma *elim-equiv-transformation-consistent*:
$A \models$ *FEq* φ ψ $\longleftrightarrow$ $A \models$ *FAnd* (*FImp* φ ψ) (*FImp* ψ φ)
by *auto*

lemma *elim-equiv-explicit*: *elim-equiv* φ ψ $\Longrightarrow \forall A.\ A \models \varphi \longleftrightarrow A \models \psi$
by (*induct rule*: *elim-equiv.induct*, *auto*)

lemma *elim-equiv-consistent*: *preserves-un-sat elim-equiv*
unfolding *preserves-un-sat-def* **by** (*simp add*: *elim-equiv-explicit*)

lemma *elimEquv-lifted-consistant*:
preserves-un-sat (*full* (*propo-rew-step elim-equiv*))
by (*simp add*: *elim-equiv-consistent*)

This function ensures that there is no equivalencies left in the formula tested by *no-equiv-symb*.

fun *no-equiv-symb* :: *'v propo* $\Rightarrow$ *bool* **where**
no-equiv-symb (*FEq* - -) = *False* |
no-equiv-symb - = *True*

Given the definition of *no-equiv-symb*, it does not depend on the formula, but only on the connective used.

lemma *no-equiv-symb-conn-characterization*[*simp*]:
fixes *c* :: *'v connective* **and** *l* :: *'v propo list*
assumes *wf*: *wf-conn c l*
shows *no-equiv-symb* (*conn c l*) $\longleftrightarrow$ $c \neq$ *CEq*
by (*metis connective.distinct*(*13*,*25*,*35*,*43*) *wf no-equiv-symb.elims*(*3*) *no-equiv-symb.simps*(*1*) *wf-conn.cases wf-conn-list*(*6*))

definition *no-equiv* **where** *no-equiv* = *all-subformula-st no-equiv-symb*

lemma *no-equiv-eq*[*simp*]:
fixes φ ψ :: *'v propo*
shows
$\neg$*no-equiv* (*FEq* φ ψ)
no-equiv FT
no-equiv FF
using *no-equiv-symb.simps*(*1*) *all-subformula-st-test-symb-true-phi* **unfolding** *no-equiv-def* **by** *auto*

The following lemma helps to reconstruct *no-equiv* expressions: this representation is easier to use than the set definition.

lemma *all-subformula-st-decomp-explicit-no-equiv*[*iff*]:
fixes φ ψ :: *'v propo*
shows
no-equiv (*FNot* φ) $\longleftrightarrow$ *no-equiv* φ
no-equiv (*FAnd* φ ψ) $\longleftrightarrow$ (*no-equiv* φ $\wedge$ *no-equiv* ψ)
no-equiv (*FOr* φ ψ) $\longleftrightarrow$ (*no-equiv* φ $\wedge$ *no-equiv* ψ)
no-equiv (*FImp* φ ψ) $\longleftrightarrow$ (*no-equiv* φ $\wedge$ *no-equiv* ψ)
by (*auto simp*: *no-equiv-def*)

A theorem to show the link between the rewrite relation *elim-equiv* and the function *no-equiv-symb*. This theorem is one of the assumption we need to characterize the transformation.

lemma *no-equiv-elim-equiv-step*:

10 More aggressive simplifications: Removing true and false at the beginning

10.1 Transformation

We should remove *FT* and *FF* at the beginning and not in the middle of the algorithm. To do this, we have to use more rules (one for each connective):

inductive *elimTBFull* **where**
ElimTBFull1[*simp*]: *elimTBFull* (*FAnd* φ *FT*) φ |
ElimTBFull1'[*simp*]: *elimTBFull* (*FAnd FT* φ) φ |

ElimTBFull2[*simp*]: *elimTBFull* (*FAnd* φ *FF*) *FF* |
ElimTBFull2'[*simp*]: *elimTBFull* (*FAnd FF* φ) *FF* |

ElimTBFull3[*simp*]: *elimTBFull* (*FOr* φ *FT*) *FT* |
ElimTBFull3'[*simp*]: *elimTBFull* (*FOr FT* φ) *FT* |

ElimTBFull4[*simp*]: *elimTBFull* (*FOr* φ *FF*) φ |
ElimTBFull4'[*simp*]: *elimTBFull* (*FOr FF* φ) φ |

ElimTBFull5[*simp*]: *elimTBFull* (*FNot FT*) *FF* |
ElimTBFull5'[*simp*]: *elimTBFull* (*FNot FF*) *FT* |

ElimTBFull6-l[*simp*]: *elimTBFull* (*FImp FT* φ) φ |
ElimTBFull6-l'[*simp*]: *elimTBFull* (*FImp FF* φ) *FT* |
ElimTBFull6-r[*simp*]: *elimTBFull* (*FImp* φ *FT*) *FT* |
ElimTBFull6-r'[*simp*]: *elimTBFull* (*FImp* φ *FF*) (*FNot* φ) |

ElimTBFull7-l[*simp*]: *elimTBFull* (*FEq FT* φ) φ |
ElimTBFull7-l'[*simp*]: *elimTBFull* (*FEq FF* φ) (*FNot* φ) |
ElimTBFull7-r[*simp*]: *elimTBFull* (*FEq* φ *FT*) φ |
ElimTBFull7-r'[*simp*]: *elimTBFull* (*FEq* φ *FF*) (*FNot* φ)

The transformation is still consistent.

lemma *elimTBFull-consistent*: *preserves-un-sat elimTBFull*
proof −

When a formula is in CNF form, then there is equisatisfiability. Remark that the definition for the entailment are slightly different: *op* $\models$ uses a function assigning *True* or *False*, while *op* $\models s$ uses a set where being in the list means entailment of a literal.

14 Partial Clausal Logic

We here define marked literals (that will be used in both DPLL and CDCL) and the entailment corresponding to it.

14.1 Marked Literals

14.1.1 Definition

datatype (*'v*, *'lvl*, *'mark*) *marked-lit* =
is-marked: *Marked* (*lit-of*: *'v literal*) (*level-of*: *'lvl*) |
is-proped: *Propagated* (*lit-of*: *'v literal*) (*mark-of*: *'mark*)

lemma *marked-lit-list-induct*[*case-names nil marked proped*]:
assumes *P* [] **and**
$\bigwedge$*L l xs*. *P xs* $\Longrightarrow$ *P* (*Marked L l* # *xs*) **and**
$\bigwedge$*L m xs*. *P xs* $\Longrightarrow$ *P* (*Propagated L m* # *xs*)
shows *P xs*
using *assms* **apply** (*induction xs*, *simp*)
by (*rename-tac a xs*, *case-tac a*) *auto*

lemma *is-marked-ex-Marked*:

14.6 Abstract Clause Representation

We will abstract the representation of clause and clauses via two locales. We expect our representation to behave like multiset, but the internal representation can be done using list or whatever other representation.

We assume the following:

- there is an equivalent to adding and removing a literal and to taking the union of clauses.

locale *raw-cls* =
  fixes
    mset-cls:: *'cls* ⇒ *'v clause* **and**
    insert-cls :: *'v literal* ⇒ *'cls* ⇒ *'cls* **and**
    remove-lit :: *'v literal* ⇒ *'cls* ⇒ *'cls*
  assumes
    insert-cls[*simp*]: *mset-cls* (*insert-cls L C*) = *mset-cls C* + {#*L*#} **and**
    remove-lit[*simp*]: *mset-cls* (*remove-lit L C*) = *remove1-mset L* (*mset-cls C*)
begin
end

locale *raw-ccls-union* =

fixes
  mset-cls:: $'cls \Rightarrow 'v$ *clause* **and**
  union-cls :: $'cls \Rightarrow 'cls \Rightarrow 'cls$ **and**
  insert-cls :: $'v$ *literal* $\Rightarrow 'cls \Rightarrow 'cls$ **and**
  remove-lit :: $'v$ *literal* $\Rightarrow 'cls \Rightarrow 'cls$
assumes
  insert-ccls[*simp*]: *mset-cls* (*insert-cls* L C) = *mset-cls* C + {#L#} **and**
  mset-ccls-union-cls[*simp*]: *mset-cls* (*union-cls* C D) = *mset-cls* C #∪ *mset-cls* D **and**
  remove-clit[*simp*]: *mset-cls* (*remove-lit* L C) = *remove1-mset* L (*mset-cls* C)
begin
end

Instantiation of the previous locale, in an unnamed context to avoid polluating with simp rules

context
begin
  interpretation *list-cls*: *raw-cls mset*
    op # *remove1*
    by *unfold-locales* (*auto simp*: *union-mset-list ex-mset*)

  interpretation *cls-cls*: *raw-cls id*
    $\lambda L\ C.\ C$ + {#L#} *remove1-mset*
    by *unfold-locales* (*auto simp*: *union-mset-list*)

  interpretation *list-cls*: *raw-ccls-union mset*
    union-mset-list
    op # *remove1*
    by *unfold-locales* (*auto simp*: *union-mset-list ex-mset*)

  interpretation *cls-cls*: *raw-ccls-union id*
    op #∪ $\lambda L\ C.\ C$ + {#L#} *remove1-mset*
    by *unfold-locales* (*auto simp*: *union-mset-list*)
end

Over the abstract clauses, we have the following properties:

- We can insert a clause
- We can take the union (used only in proofs for the definition of *clauses*)
- there is an operator indicating whether the abstract clause is contained or not
- if a concrete clause is contained the abstract clauses, then there is an abstract clause

locale *raw-clss* =

15 Measure

This measure show the termination of the core of CDCL: each step improves the number of literals we know for sure.

This measure can also be seen as the increasing lexicographic order: it is an order on bounded sequences, when each element is bounded. The proof involves a measure like the one defined here (the same?).

We cannot add a like condition *atms-of C'* ⊆ *atms-of-ms N* because to ensure that we can backjump even if the last decision variable has disappeared.

The part of the condition *atm-of L* ∈ *atm-of* ‘ *lits-of-l* (*F'* @ *Marked K* () # *F*) is important, otherwise you are not sure that you can backtrack.

16.3.1 Definition

Well-foundedness The bounds are the following:

- *1* + *card* (*atms-of-ms* A): *card* (*atms-of-ms* A) is an upper bound on the length of the list. As *get-all-marked-decomposition* appends an possibly empty couple at the end, adding one is needed.
- *2* + *card* (*atms-of-ms* A): *card* (*atms-of-ms* A) is an upper bound on the number of elements, where adding one is necessary for the same reason as for the bound on the list, and one is needed to have a strict bound.

16.3.4 Normal Forms

We prove that given a normal form of DPLL, with some invariants, the either N is satisfiable and the built valuation M is a model; or N is unsatisfiable.

Idea of the proof: We have to prove tat *satisfiable* N, $\neg$ M $\models$*as* N and there is no remaining step is incompatible.

1. The *decide* rules tells us that every variable in N has a value.
2. $\neg$ M $\models$*as* N tells us that there is conflict.
3. There is at least one decision in the trail (otherwise, M is a model of N).
4. Now if we build the clause with all the decision literals of the trail, we can apply the *backjump* rule.

   The assumption are saying that we have a finite upper bound A for the literals, that we cannot do any step *no-step dpll-bj S*

```
theorem dpll-backjump-final-state:
  fixes A :: 'v literal multiset set and S T :: 'st
  assumes
    atms-of-mm (clausesNOT S) ⊆ atms-of-ms A and
    atm-of ‘ lits-of-l (trail S) ⊆ atms-of-ms A and

We have to assume the following:

- *inv* S: the invariant holds in the inital state.
- A is a (finite *finite* A) superset of the literals in the trail *atm-of* ‘ *lits-of-l* (*trail* S) $\subseteq$ *atms-of-ms* A and in the clauses *atms-of-mm* ($clauses_{NOT}$ S) $\subseteq$ *atms-of-ms* A. This can the the set of all the literals in the starting set of clauses.
- *no-dup* (*trail* S): no duplicate in the trail. This is invariant along the path.

16.7.2 Increasing restarts

To add restarts we needs some assumptions on the predicate (called $cdcl_{NOT}$ here):

- a function f that is strictly monotonic. The first step is actually only used as a restart to clean the state (e.g. to ensure that the trail is empty). Then we assume that $(1::'a) \leq f$ n for $(1::'a) \leq n$: it means that between two consecutive restarts, at least one step will be done. This is necessary to avoid sequence. like: full – restart – full – ...

- a measure μ: it should decrease under the assumptions *bound-inv*, whenever a $cdcl_{NOT}$ or a *restart* is done. A parameter is given to μ: for conflict- driven clause learning, it is an upper-bound of the clauses. We are assuming that such a bound can be found after a restart whenever the invariant holds.
- we also assume that the measure decrease after any $cdcl_{NOT}$ step.
- an invariant on the states $cdcl_{NOT}$*-inv* that also holds after restarts.
- it is *not required* that the measure decrease with respect to restarts, but the measure has to be bound by some function μ*-bound* taking the same parameter as μ and the initial state of the considered $cdcl_{NOT}$ chain.

19.3.5 Learned Clause

This invariant shows that:

- the learned clauses are entailed by the initial set of clauses.
- the conflicting clause is entailed by the initial set of clauses.
- the marks are entailed by the clauses. A more precise version would be to show that either these marked are learned or are in the set of clauses

19.5.3 Literal of highest level in conflicting clauses

One important property of the $cdcl_W$ with strategy is that, whenever a conflict takes place, there is at least a literal of level k involved (except if we have derived the false clause). The reason is that we apply conflicts before a decision is taken.

20.2 Simple Implementation of DPLL

20.2.1 Combining the propagate and decide: a DPLL step

definition *DPLL-step* :: *int* $dpll_W$*-marked-lits* × *int literal list list*
⇒ *int* $dpll_W$*-marked-lits* × *int literal list list* **where**
DPLL-step = (λ(*Ms*, *N*).
(*case find-first-unit-clause N Ms of*
Some (*L*, -) ⇒ (*Propagated L* () # *Ms*, *N*)
| - ⇒
if ∃ *C* ∈ *set N*. (∀ *c* ∈ *set C*. −*c* ∈ *lits-of-l Ms*)
then
(*case backtrack-split Ms of*
(-, *L* # *M*) ⇒ (*Propagated* (− (*lit-of L*)) () # *M*, *N*)
| (-, -) ⇒ (*Ms*, *N*)
)
else
(*case find-first-unused-var N* (*lits-of-l Ms*) *of*
Some a ⇒ (*Marked a* () # *Ms*, *N*)
| *None* ⇒ (*Ms*, *N*))))

Example of propagation:

value *DPLL-step* ([*Marked* (*Neg 1*) ()], [[*Pos* (*1*::*int*), *Neg 2*]])

We define the conversion function between the states as defined in *Prop-DPLL* (with multisets) and here (with lists).

abbreviation *toS* ≡ λ(*Ms*::(*int*, *unit*, *unit*) *marked-lit list*)

20.2.3 Code export

A conversion to *DPLL-W-Implementation.dpll$_W$-state* **definition** *Con* :: (*int*, *unit*, *unit*) *marked-lit list* × *int literal list list*
⇒ *dpll$_W$-state* **where**
Con xs = *state-of* (*if dpll$_W$-all-inv* (*toS* (*fst xs*) (*snd xs*)) *then xs else* ([], []))
lemma [*code abstype*]:
Con (*rough-state-of S*) = *S*
using *rough-state-of*[*of S*] **unfolding** *Con-def* **by** *auto*

declare *rough-state-of-DPLL-step′-DPLL-step*[*code abstract*]

lemma *Con-DPLL-step-rough-state-of-state-of*[*simp*]:
Con (*DPLL-step* (*rough-state-of s*)) = *state-of* (*DPLL-step* (*rough-state-of s*))
unfolding *Con-def* **by** (*metis* (*mono-tags*, *lifting*) *DPLL-step-dpll$_W$-conc-inv mem-Collect-eq prod.case-eq-if*)

A slightly different version of *DPLL-tot* where the returned boolean indicates the result.

definition *DPLL-tot-rep* **where**
DPLL-tot-rep S =
(*let* (*M*, *N*) = (*rough-state-of* (*DPLL-tot S*)) *in* (∀ *A* ∈ *set N*. (∃ *a*∈*set A*. *a* ∈ *lits-of-l* (*M*)), *M*))

One version of the generated SML code is here, but not included in the generated document. The only differences are:

- export *′a literal* from the SML Module *Clausal-Logic*;
- export the constructor *Con* from *DPLL-W-Implementation*;

- export the *int* constructor from *Arith*.

  All these allows to test on the code on some examples.

The condition of the differences of cardinality has to be strict. Otherwise, you could be in a strange state, where nothing remains to do, but a restart is done. See the proof of well-foundedness.

Luby sequences are defined by:

- $2^k - 1$, if $i = (2::'a)^k - (1::'a)$
- *luby-sequence-core* $(i - 2^{k - 1} + 1)$, if $(2::'a)^{k - 1} \leq i$ and $i \leq (2::'a)^k - (1::'a)$

Then the sequence is then scaled by a constant unit run (called *ur* here), strictly positive.

24 2-Watched-Literal

theory *CDCL-Two-Watched-Literals*
imports *CDCL-WNOT*
begin

We will directly on the two-watched literals datastructure with lists: it could be also seen as a state over some abstract clause representation we would later refine as lists. However, as we need a way to select element from a clause, working on lists is better.

24.1 Datastructure and Access Functions

Only the 2-watched literals have to be verified here: the backtrack level and the trail that appear in the state are not related to the 2-watched algoritm.

datatype *'v twl-clause* =
TWL-Clause (*watched*: *'v literal list*) (*unwatched*: *'v literal list*)

24.2 Invariants

We need the following property about updates: if there is a literal L with $-L$ in the trail, and L is not watched, then it stays unwatched; i.e., while updating with *rewatch* it does not get swap with a watched literal L' such that $-L'$ is in the trail.

primrec $watched\text{-}decided\text{-}most\text{-}recently :: ('v,\ 'lvl,\ 'mark)\ marked\text{-}lit\ list \Rightarrow$
$'v\ twl\text{-}clause \Rightarrow bool$
where
$watched\text{-}decided\text{-}most\text{-}recently\ M\ (TWL\text{-}Clause\ W\ UW) \longleftrightarrow$
$(\forall L' \in set\ W.\ \forall L \in set\ UW.$
$-L' \in lits\text{-}of\text{-}l\ M \longrightarrow -L \in lits\text{-}of\text{-}l\ M \longrightarrow L \notin\#\ mset\ W \longrightarrow$

index (*map lit-of M*) ($-L'$) $\leq$ *index* (*map lit-of M*) ($-L$))

Here are the invariant strictly related to the 2-WL data structure.
